# PHENYLINDOLE DERIVATIVES AS 5-HT<sub>2A</sub> RECEPTOR ANTAGONISTS

The present invention relates to a class of indole derivatives which act on serotonin receptors (also known as 5-hydroxytryptamine or 5-HT receptors). More particularly, the invention concerns 3-(piperidin-4-yl)-1*H*-indole derivatives bearing an optionally substituted phenyl moiety at the 2-position of the indole ring system and an alkyl or aryl-alkyl substituent on the nitrogen atom of the piperidine ring. These compounds are selective antagonists of the human 5-HT<sub>2A</sub> receptor and are therefore useful as pharmaceutical agents, especially in the treatment and/or prevention of adverse conditions of the central nervous system, including psychotic disorders such as schizophrenia.

Schizophrenia is a disorder which is conventionally treated with drugs known as neuroleptics. In many cases, the symptoms of schizophrenia can be treated successfully with so-called "classical" neuroleptic agents such as haloperidol. Classical neuroleptics generally are antagonists at dopamine D<sub>2</sub> receptors.

Notwithstanding their beneficial antipsychotic effects, classical neuroleptic agents such as haloperidol are frequently responsible for eliciting acute extrapyramidal symptoms (movement disorders) and neuroendocrine (hormonal) disturbances. These side-effects, which plainly detract from the clinical desirability of classical neuroleptics, are believed to be attributable to D<sub>2</sub> receptor blockade in the striatal region of the brain.

The compound (+)- $\alpha$ -(2,3-dimethoxyphenyl)-1-[2-(4-fluorophenyl)-ethyl]-4-piperidinemethanol (also known as MDL-100,907) is described in WO 91/18602. In preclinical studies, MDL-100,907 failed to induce catalepsy and failed to block apomorphine-induced stereotyped behaviour in animal models, strongly suggesting that this compound would be free from any liability to cause extrapyramidal side-effects. MDL-100,907 is currently undergoing clinical trials in schizophrenic patients and has

demonstrated efficacy in a multicentre, placebo-controlled study for antipsychotic potential, with no neurological adverse effects.

Pharmacologically, MDL-100,907 has been shown to be a potent antagonist of human 5-HT<sub>2A</sub> receptors, whilst being essentially devoid of activity at the human dopamine D<sub>2</sub> receptor. It is accordingly believed that compounds which can interact selectively with the 5-HT<sub>2A</sub> receptor relative to the dopamine D<sub>2</sub> receptor will display the beneficial level of antipsychotic activity associated with 5-HT<sub>2A</sub> receptor antagonism, whilst minimizing or even avoiding the extrapyramidal and other side-effects arising from an interaction with dopamine D<sub>2</sub> receptors.

The compounds of the present invention are potent antagonists of the human 5-HT<sub>2A</sub> receptor, and are accordingly of benefit in the treatment and/or prevention of psychotic disorders such as schizophrenia. The compounds of the invention may display more effective binding to the human 5-HT<sub>2A</sub> receptor than to the human dopamine D<sub>2</sub> receptor, and they can therefore be expected to manifest fewer side-effects than compounds which do not discriminate in their binding affinity as between 5-HT<sub>2A</sub> and D<sub>2</sub> receptors.

By virtue of their potent human 5-HT<sub>2A</sub> receptor antagonist activity, the compounds of the present invention are also effective in the treatment of neurological conditions including depression, anxiety, panic disorder, obsessive-compulsive disorder, pain, sleep disorders such as insomnia, eating disorders such as anorexia nervosa, and dependency or acute toxicity associated with narcotic agents such as LSD or MDMA; and cardiovascular conditions including variant angina, Raynaud's phenomenon, intermittent claudication, coronary and peripheral vasospasms, fibromyalgia, cardiac arrhythmias and thrombotic illness. They may also be generally of benefit in the inhibition of platelet aggregation, as well as in controlling the extrapyramidal symptoms associated with the administration of neuroleptic agents. They may further be effective in the lowering of intraocular pressure and may

therefore be beneficial in treating glaucoma (cf. T. Mano *et al.* and H. Takaneka *et al.*, *Investigative Ophthalmology and Visual Science*, 1995, vol. 36, pages 719 and 734 respectively).

Being 5-HT<sub>2A</sub> receptor antagonists, the compounds of the present  
5 invention may also be beneficial in preventing or reducing the toxic symptoms associated with the intake of ergovaline in animals consuming *Acremonium coenophialum* infected tall fescue (cf. D. C. Dyer, *Life Sciences*, 1993, 53, 223-228).

In JP-A-3-264581 is described a class of 3-(piperidin-4-yl)-1*H*-indole  
10 analogues bearing *inter alia* an optionally substituted phenyl group at the 2-position of the indole nucleus and a heterocyclic moiety attached through an alkylene linkage to the nitrogen atom of the piperidine ring. These compounds are stated therein to have a strong serotonin-2 receptor  
15 antagonist action and hence to be useful as medicines for the treatment of diseases of the circulatory system, and of psychiatric diseases such as depression or schizophrenia. There is, however, no disclosure nor any suggestion in JP-A-3-264581 of replacing the precisely defined heterocycl-alkyl substituent on the piperidine ring with an alkyl or aryl-alkyl moiety.

20 GB-1465826 describes a variety of indolylpiperidine-butyrophenones bearing *inter alia* a phenyl group at the 2-position of the indole ring system. These compounds are alleged therein to show activities typical of neuroleptics and therefore to be of potential interest as depressants of the central nervous system, as sedatives and as  
25 tranquilizers. However, nowhere in GB-1465826 is there any disclosure or suggestion of replacing the 4-fluorobutyrophenone substituent on the piperidine ring with an alkyl or aryl-alkyl moiety.

The compounds according to the present invention are potent and selective 5-HT<sub>2A</sub> receptor antagonists having a human 5-HT<sub>2A</sub> receptor  
30 binding affinity (K<sub>i</sub>) of 100 nM or less, typically of 50 nM or less and preferably of 10 nM or less. The compounds of the invention may possess

at least a 10-fold selective affinity, suitably at least a 20-fold selective affinity and preferably at least a 50-fold selective affinity, for the human 5-HT<sub>2A</sub> receptor relative to the human dopamine D<sub>2</sub> receptor.

salt of the active compound, such as the decanoate salt, may be adapted to provide a depot preparation for intramuscular injection. An erodible polymer containing the active ingredient may be envisaged. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. Favoured unit dosage forms contain from 1 to 100 mg, for example 1, 2, 5, 10, 25, 50 or 100 mg, of the active ingredient. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil

suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as  
5    tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinyl-pyrrolidone or gelatin.

In the treatment of schizophrenia, a suitable dosage level is about 0.01 to 250 mg/kg per day, preferably about 0.05 to 100 mg/kg per day, and especially about 0.05 to 5 mg/kg per day. The compounds may be  
10    administered on a regimen of 1 to 4 times per day.

If desired, the compounds according to this invention may be co-administered with another anti-schizophrenic medicament, for example one producing its effects *via* dopamine D<sub>2</sub> and/or D<sub>4</sub> receptor subtype blockade. In such circumstances, an enhanced anti-schizophrenic effect  
15    may be envisaged without a corresponding increase in side-effects such as those caused by, for example, D<sub>2</sub> receptor subtype blockade; or a comparable anti-schizophrenic effect with reduced side-effects may alternatively be envisaged. Such co-administration may be desirable where a patient is already established on an anti-schizophrenic treatment  
20    regime involving conventional anti-schizophrenic medicaments. Suitable anti-schizophrenic medicaments of use in combination with the compounds according to the present invention include haloperidol, chlorpromazine, mesoridazine, thioridazine, acetophenazine, fluphenazine, perphenazine, trifluoperazine, chlorprothixene, thiothixene, clozapine, olanzapine,  
25    pimozone, molindone, loxapine, sulpiride, risperidone, xanomeline, fananserine and ziprasidone, and pharmaceutically acceptable salts thereof.

The compounds according to the present invention may be prepared by a process which comprises attachment of the R<sup>1</sup> moiety to a compound of formula III:

(III)

wherein A, B, X and Y are as defined above; by conventional means including N-alkylation.

5 Attachment of the R<sup>1</sup> moiety to the compounds of formula III may conveniently be effected by standard alkylation techniques. One example thereof comprises treatment with an alkyl halide such as methyl iodide, or an aryl(C<sub>1-6</sub>)alkyl halide such as benzyl bromide or 2-phenylethyl bromide, typically under basic conditions, e.g. potassium carbonate or caesium carbonate in *N,N*-dimethylformamide. Another example comprises  
10 treatment of the compound of formula III with an aryl(C<sub>1-6</sub>)alkyl mesylate such as 2-phenylethyl methanesulphonate, typically in the presence of sodium carbonate and sodium iodide, in a suitable solvent such as 1,2-dimethoxyethane.

15 Alternatively, the R<sup>1</sup> moiety may conveniently be attached by reductive alkylation, which may be accomplished in a single step, or as a two-step procedure. The single-step approach suitably comprises treating the required compound of formula III as defined above with the appropriate aldehyde, e.g. formaldehyde, benzaldehyde or  
20 phenylacetaldehyde, in the presence of a reducing agent such as sodium cyanoborohydride. In a typical two-step procedure, for the preparation of a compound of formula I wherein R<sup>1</sup> corresponds to a group of formula -CH<sub>2</sub>R<sup>1a</sup>, a carboxylic acid derivative of formula R<sup>1a</sup>-CO<sub>2</sub>H is condensed with the required compound of formula III, suitably in the presence of  
25 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride and

1-hydroxybenzotriazole hydrate, to afford a compound corresponding to formula I wherein  $R^1$  represents  $-COR^{1a}$ ; the carbonyl group thereof can then be reduced, for example by treatment with diisobutylaluminium hydride, and the required compound of formula I thereby obtained.

5        The compounds of formula III above may be prepared by reduction of the corresponding compound of formula IV:

(IV)

10        wherein A, B, X and Y are as defined above.

Similarly, the compounds according to the invention may be prepared by a process which comprises reducing a compound of formula V:

(V)

15

wherein A, B, X, Y and  $R^1$  are as defined above.

Reduction of the compounds of formula IV or V may conveniently be accomplished by conventional catalytic hydrogenation, which comprises treating the appropriate compound with hydrogen in the presence of a

hydrogenation catalyst such as palladium on charcoal. Alternatively, compound IV or V may be reduced by transfer hydrogenation using a hydrogenation catalyst such as palladium on charcoal in the presence of a hydrogen donor such as ammonium formate, typically in a lower alkanol solvent such as methanol.

The intermediates of formula IV and V may be prepared by reacting a compound of formula VI with the appropriate piperidinone derivative of formula VII:

(VI)

(VII)

wherein A, B, X and Y are as defined above, and R<sup>1b</sup> represents hydrogen or corresponds to the moiety R<sup>1</sup> as defined above.

The reaction between compounds VI and VII is conveniently effected by heating the reactants under acidic conditions, typically in a mixture of phosphoric acid and acetic acid at a temperature in the region of 80°C.

The intermediates of formula III and of formula V above are novel compounds in their own right, and represent further features of the present invention.

In another procedure, the compounds according to the invention may be prepared by a process which comprises reacting a compound of formula VIII or an acid addition salt thereof, typically the hydrochloride salt, with a compound of formula IX:

(VIII)

(IX)

wherein A, B, X, Y and R<sup>1</sup> are as defined above.

The reaction between compounds VIII and IX, which is an example  
5 of the well-known Fischer indole synthesis, is suitably effected by stirring in ethanol at 25°C, followed by heating in trifluoroacetic acid at 70°C.

In a further procedure, the compounds according to the invention  
may be prepared by a process which comprises reacting a compound of  
formula X with a compound of formula XI (cf. Larock and Yum, *J. Am.*  
10 *Chem. Soc.*, 1991, 113, 6689):

(X)

(XI)

wherein A, B, X, Y and R<sup>1</sup> are as defined above; in the presence of a  
15 transition metal catalyst.

The transition metal catalyst employed in the reaction between  
compounds X and XI is suitably a palladium-containing catalyst. Typical  
catalysts include palladium(II) acetate, optionally in the presence of  
triphenylphosphine, and dichlorobis(triphenylphosphine)palladium(II). A  
20 preferred catalyst is dichlorobis(triphenylphosphine)palladium(II).

The transition metal catalysed indole formation reaction between compounds X and XI is advantageously carried out under basic conditions. Typical basic reagents of use in the reaction include sodium carbonate, potassium carbonate, sodium acetate or potassium acetate, optionally in the presence of lithium chloride or tetra-*n*-butylammonium chloride; and  
5 tetramethylguanidine. A preferred base is tetramethylguanidine. The reaction is conveniently effected in a polar aprotic organic solvent such as *N,N*-dimethylformamide, typically at an elevated temperature, e.g. a temperature in the region of 80-110°C.

10 Where they are not commercially available, the starting materials of formula VI, VII, VIII, IX, X and XI may be prepared by procedures analogous to those described in the accompanying Examples, or by standard methods well known from the art.

It will be appreciated that any compound of formula I initially  
15 obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further desired compound of formula I using techniques known from the art.

Where the above-described processes for the preparation of the compounds of use in the invention give rise to mixtures of stereoisomers,  
20 these isomers may be separated by conventional techniques such as preparative chromatography. The compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The compounds may, for example, be resolved into their component enantiomers by standard techniques such as  
25 preparative HPLC, or the formation of diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-*p*-toluoyl-*d*-tartaric acid and/or (+)-di-*p*-toluoyl-*l*-tartaric acid, followed by fractional crystallization and regeneration of the free base. The compounds may also be resolved by formation of diastereomeric esters or amides, followed by  
30 chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in *Protective Groups in Organic Chemistry*, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene & P.G.M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, 1991. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The following Examples illustrate the preparation of compounds of use in the invention.

The compounds in accordance with this invention potentially inhibit [<sup>3</sup>H]-ketanserin binding to the human 5-HT<sub>2A</sub> receptor expressed in clonal cell lines. Moreover, those compounds of the invention which have been tested display a selective affinity for the 5-HT<sub>2A</sub> receptor relative to the dopamine D<sub>2</sub> receptor.

The compounds of the accompanying Examples were all found to possess a K<sub>i</sub> value for displacement of [<sup>3</sup>H]-ketanserin from the human 5-HT<sub>2A</sub> receptor, when expressed in Chinese hamster ovary (CHO) clonal cell lines, of 100 nM or less.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/GB 98/02552

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 13  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claims 13  
is directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
